Light Architecture

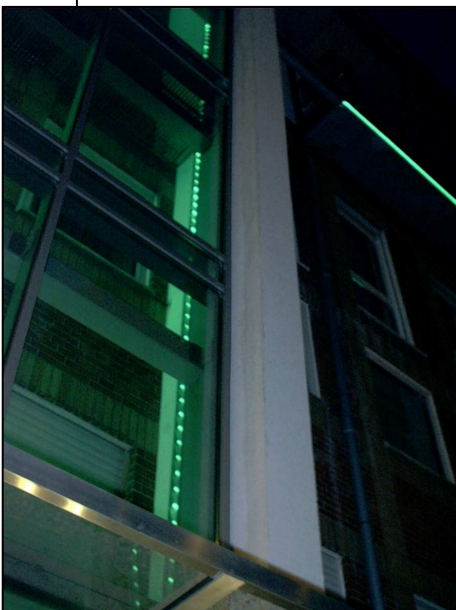

Sophisticated Presentation of Architecture with
bedea akzent

There is a growing demand on proper accentuation of stilistic architectural elements. They are not longer only a functional part of a building and tend more an more to be an instrument to arrange and order the appearance.

Our fiberoptic lighting system *bedea akzent* offers the possibility to highlight historical structures and elements of a building (Picture 1: illumination of the facade of a historical building and picture 2, accentuation of decent elements of a facade) on one hand as well as smart emphasizing of modern architectural elements (picture 3, Glass front of a business building).

bedea akzent offers a variety of advantages concerning these tasks:

- Decent, almost invisible installation of outcoupling elements
- Decentral placement of the light source itself
- Utmost variability of light character by different lens systems or filters
- Service free light emissions even at unapproachable places.
- Using these fiberoptic lighting systems, even more aspects occur to show their advantages, such as increase of safety by separation of light emission and electricity, and lack of influence of environmental conditions.
