## Accentuated Effects by Mounting Beamers

The German company *bedea* Berkenhoff & Drebes has made a name for its exclusive light design for higher pretensions. The outcoupling elements of the *bedea akzent* product range may be used indoors as well as outdoors for many illumination purposes. Using mounting beamers, various illumination effects can be achieved with invisible lighting media.

Mounting beamers are to be built in ceilings or walls, and may even be integrated in parquet floors. It's an advantage of this technology, that light source and light outlet are separated, implementing the possibility to integrate these beamers within any given ambience.

In the same way, that the whole variety of mounting beamers can be used within indoor areas, they may be installed outdoors. Thus, not only interiors may be illuminated exclusively, but gardens, fronts, stairways, and paties can be accentuated with spotlights, floodlight, or light lines. Dramatic performances of light arrangements bring architectural designed living areas in its true light, supported by a state-of-the-art fiber optic lighting system.

It goes with out saying, that mounting beamers may be combined with other components out of the *bedea akzent* programme, such as underwater beamers for fountains and ponds, with light tones for terraces. As only light is transmitted by the fiber optic cables, the installation of all of the components is easy and safe to be handled. Whether for private purposes, or for public installations, the fiber optic technology offers not only advantages concerning design, but also regarding economics, compared to conventional lighting possibilities.
